

INSTALL

- Change the source code
 - sudo ./configure --prefix=/usr
 - Install all the nagios dependencies
 - sudo apt-get install apache2 libapache2-dev libssl-dev libgd2-dev libjpeg-dev libpng-dev libtiff-dev libwebp-dev libz-dev libbz2-dev libncurses5-dev libncurses5-dev libncursesw5-dev libpcre3-dev libpcre3-dev libpcre3-dev libpcre3-dev
- Download & extract Nagios source code
 - tar -zxvf nagios-4.4.0.tar.gz
- Compile & configure
 - Configure → this file helps to check if all the files are there in the extracted folder, all the essentials
 - sudo ./configure --with-httpd=/usr/local/apache2 --with-ssl=/usr/local/ssl --with-gd2=/usr/local/gd2 --with-jpeg=/usr/local/jpeg --with-png=/usr/local/png --with-tiff=/usr/local/tiff --with-webp=/usr/local/webp --with-zlib=/usr/local/zlib --with-bzip2=/usr/local/bzip2 --with-ncurses5=/usr/local/ncurses5 --with-ncursesw5=/usr/local/ncursesw5 --with-pcre3=/usr/local/pcre3 --with-pcre3-dev=/usr/local/pcre3-dev
 - Or compiling
 - sudo make all
 - will all gcc & compile the data.
- Create nagios user & group
 - we are doing this manually, when installed via package manager, it automatically creates user & group for user.
- Install the binaries
 - sudo make install-groups-users
 - (creates the compiled files & creates create group & user named nagios)
- Add www-data to the nagios group
 - this helps apache to access nagios files
 - sudo usermod -s www-data nagios.
- Set auto start to nagios, at reboot
 - sudo make install-daemoninit
 - ↳ this basically tells to read from the make file of nagios & install the config files accordingly.
- Install command mode
 - so we can access nagios
 - sudo make install-commandmode
- Install config files
 - the whole nagios is installed in /usr/local/nagios
 - we need to install config files from source code file to the installed directory.
 - sudo make install-config
- Install apache config files
 - sudo make install-webconf
 - directly installs web config files in apache directory.
- Create nagiosadmin user-admin account
 - sudo htpasswd -c /usr/local/nagios/etc/htpasswd.users nagiosadmin
 - We made a website using apache, so every user should not be able to access this website, so we are using htpasswd to create a user.
- Verify the installation & config files
 - sudo /usr/local/nagios/bin/nagios -v /usr/local/nagios/etc/nagios.cfg
- Enable module in apache (we need 2 modules)
 - sudo a2enmod cgi
 - apache2enablemodule
 - sudo a2enmod rewrite
 - sudo systemctl restart apache2
 - sudo systemctl start nagios.

The BIG PICTURE

- We are basically installing Nagios with source code
- First we install all required dependencies
- Then we need apache2 because we need crux to run our Nagios
